WaveTek 
Unique Equipment Systems
for any Environment

Authentic Sea Life Exhibits

Creating a realistic experience for your visitors is a primary concern when developing or modifying an exhibit. Dolphins, penguins and other shore dwelling life require wave action to simulate their natural environment. These waves may actually improve water quality and increase the efficiency of the exhibit's life support systems.

Coral Reef and Kelp Environments

Exhibit design is as much about creating authentic surroundings as the species being displayed. Beyond the aesthetic effect of realistic side to side movement of kelp strands, live coral requires water flow to transport nutrients while carrying waste away. Wave generation performs a vital life support function as well.

Scale Modeling and Testing

Prior to actual equipment design and manufacture of a specialty wave system, WaveTek® professionals will build and test a working scale model of the exhibit. This hands-on approach assures the client that their desired effect can be created, and it also defines the specific equipment system requirements for WaveTek® engineers.

Specialty Waves

Just as waves have long been recognized as adding tremendous excitement and revenue generating capabilities to pools, there are many specialty applications where adding waves will dramatically enhance the overall entertainment value and attractiveness of a facility. WaveTek® professionals will customize a wave system based on your unique project requirements.

Specialty applications include: Aquariums • Zoos • Fountains • Lazy Rivers
Motion Picture Production • Military Training • Industrial/Scientific/Environmental
